Introduction

The diffusion of internet and the information technologies are creating continuous information flows. There is a widespread awareness of the added value and of the role that the Web has in dissemination, exploitation and promotion of the cultural tourism, especially in a country like Italy, where the cultural heritage is very important. Moreover, an open philosophy causes problems of authoritativeness in the production of contents because it is characterized by a strong interaction among users thus creating a distance between knowledge and communication. The spread of internet has brought the significant changes of communication paradigm. Nowadays the competition decreases among contents, even among from sources published in potential competition with them. In network logic, all nodes are interdependent and represent a single large hypertext. The proliferation of paths boosts a free circulation of ideas and can bring out most interesting contents[1].

The Projects

Methodologies, strategies, resources and tools created in our research group allowed us to take part in some national initiatives:

- “On-line dissemination of the historical artistic and landscaped, regional heritage” (*WeBasCH*): The project was born within the framework of collaboration between the ILC-CNR Pisa and the APT Basilicata (i.e. Agenzia di Promozione Territoriale della regione Basilicata) to experiment and implement strategies for promotion and dissemination of regional heritage.
- “*SmartCity*: new solutions for content engineering and ambient intelligence as support of cultural tourism” is a Tuscany region project (“POR Creo” session), funded by the European Community (FESR). The specific project purpose is to allow important steps forward in terms of productivity, versatility and adaptability of digital content, both textual and multimedia, through knowledge engineering techniques. Particularly we have developed and tested tools for a better preservation and enhancement of cultural heritage, identifying methodologies and solutions to meet new demand of cultural spaces in particular for tourist purposes. Partners of this project were ILC-CNR and a consortium of companies: Space, Rigel Engineering and Meta.

The specific goal of both projects is experimenting and implementing strategies for promotion and dissemination of regional heritage through an effective communication style. By exploiting potentialities of the Web 2.0, we offered a set of chosen documents and cultural routes that increase knowledge of historic and landscaped resources. The aim is to join maintenance and preservation activities and enhancement and promotion of the cultural heritage initiatives with an increasing

opening to the general user[2].

Text material for cultural tourism

The cultural tourism in Italy aims at identifying towns of artistic interest or cultural tours in wider areas linked by historical events or traditions as the "Via Francigena", "Parco Archeologico Storico Naturale delle Chiese Rupestri", "the wine roads", etc.. In this context, information available is in continuous evolution and so various that the database should be continually updated. The updating process of textual resources is an open question. The manually generation of resources is expensive and it requires the review of human experts. The manual approach is prone to errors of omission. Moreover, an approach based on an automatic updating of resources is not efficient because these are constantly evolving, this reason advises against an exclusive use of automatic applications. Especially when it comes to tourism, for which the Web offers constantly new ideas: a new park, an archaeological site discovered, etc..

There are many European initiatives within Cultural Heritage that aim to develop knowledge and enhancement of digital cultural heritage that have been undertaken. Among these, "Minerva" and "Michael" have been coordinated by the Italian Ministry for Cultural Heritage. Minerva has developed a platform of guidelines and recommendations, which are shared by European member states, for the digitization of cultural heritage and its network access. Similar information can be considered the reliable source of knowledge, especially because they were created with specific objectives:

- ✓ accessibility and visibility improvement of European digital cultural resources;
- ✓ support development of the European Digital Library for a better access to the cultural resources;
- ✓ contribution to increasing the interoperability among existing networks;
- ✓ promoting the use of digital cultural resources by business and citizens.

However the creation of this kind of resources is also referred to written text material such as brochures and web advertisement, that often is difficult to find, and retrieve. Such data regard an important source of information but since it tends to be original, recent and ephemeral can be considered a typical material of Grey Literature.

Specific strategies for texts acquisition

We have dealt the creation of the text corpus with different strategies in the two projects. Different needs of each project have guided the choices of the best acquisition strategy and all text material has been collected in two steps:

1. We built a starting text corpus (hereafter C0) which was exploited to generate new linguistic resources and enriching the ones available from TextPower^[3] project.
2. On the basis of these resources, we enlarged C0 to create the reference corpus.

CO in *SmartCity*

The first acquisition strategy in *SmartCity* project concerned the creation of a domain corpus "Empoli e dintorni", composed of historical, artistic and tourist documents related to the specific geographical area. Among activities of the project it has been possible collaborate with the library of Empoli and Cerreto Guidi for the retrieval of textual material.

On a first group of documents provided by the library of Empoli, we attempted to select material of interest in order to deal all the most important themes of Empoli and surroundings. On the basis of

^[1]Project made for building of terminological resources and enrichment and annotation of textual material

these texts we generated the Training Corpus whose size is almost 110,00 occurrences of words.

CO in *WeBasCH*

A different approach has been followed about *WeBasCH* project where all text material has retrieved on-line. The APT Basilicata provided us with a list of institutional websites. The items of the list more related to historical, artistic and landscaped regional heritage were selected and browsed by using automatic spiders and parsers, for the creation of a text corpus. Much of documentation available in internet can be assimilated to the “grey literature”, since it has been produced by the authors and institutions outside publishing, particularly the websites of regional entities.

Text corpus to linguistic resources

C0 was exploited to generate new linguistic resources and integrating the ones already available. All textual material obtained has indexed and, after a tagging phase with the PiTagger² tool, we could identify all lemmas and relative POS in each document[4].

PiTagger associates each word to the related lemma by using the morphological component of the Italian language PiMorfo³. Then it solves the ambiguities by following a statistical approach and with the help of a training corpus.

Later on, all *multiword* expression (MWE) were extracted from C0 by exploiting pattern matching techniques. Typically for the Italian syntactic construction, the most productive linguistic patterns are N-preposition-N and ADj-N/N-ADj. Statistical algorithms analyze the distributions frequency of each pattern identified. On the basis of results we extracted a set of semantically relevant terms and concepts for the cultural heritage domain. The analysis of the collected texts by means of linguistic tools (morphological engine and tagger) is fundamental for productive application of the statistical functions of extraction[5].

We exploited enriched text material, that composes C0, to build weighed domain lexicons besides. Starting from a small set of relevant pivot terms a lexicon is obtained by means of *mutual information* criteria. Statistical algorithms analyze and weigh the frequency of the co-occurrence of each word with the pivot terms. The domain lexicons can be used to evaluate the relevance of a document for that domain, in this case it is most important to establish a minimal threshold.

Reference (text) Corpus

Since textual documentation collected didn't cover exhaustively any events and cultural resources, we tried to increase the amount of textual material available, in order to find a maximum coverage of information and knowledge. In both projects we used a new search strategy of text material retrieval, namely, we used extracted knowledge and specialized crawlers that work on a bulk of text material available on-line. In a next phase we have developed other tools that, by using specific semantic filters, make a ranking the documents and evaluate their relevance with the specific domain. All extracted documents were joined in C0 corpus to build the reference (text) corpus.

The (text) reference Corpus created in SMARTCITY project consists of 2219 text units:

- 1634 units come from the material provided by the library of Empoli and Cerreto Guidi, about 1.000.000 (997299) words;
- 585 units are related to texts retrieved on the Web, little more than 850.00 words (857355).

² PiTagger is an important component for text lemmatization and tagging and constitutes a software module of PiSystem: integrated system for processing of textual and lexical materials.

³ PiMorfo: system for morphological analysis of the Italian language.

At the end of the project the specific Corpus has been reorganized in 650 documents in XML format.

In the *WeBasCH* project, the (text) reference Corpus instead is constituted of almost 2 million and half words. As it described, the creation required two phases, in which we retrieved documents from the Web and built the reference (text) corpus.

DBT-Faccette

The intelligent browsing system of text, named "DBT Faccette", is a customization of the categorization system used in librarianship. Its uniqueness lies in possibility of exploiting the semantic relevant elements (or "micro semantics") identified in the text for suggesting a further search. This feature makes most important the availability of an annotated corpus.

The text corpus is originally a set of text files. Inside these texts specific tools have identified annotations of various kinds: information related to words, phrases and piece of text. However it is necessary to organize the annotated texts in a coherent way and orderly, for a better storage, management and expansibility over time.

The corpus becomes a collection of digital sources containing accurate semantic annotations and necessary information to managing of the textual sources.

A useful way to imagine a good browsing system is to assume the final usage scenarios. Many developers often tend to adopt "reference systems" implicit, made of the individual experiences. Since the "reference system" of a user is not necessarily identical to ours, it's easy to fall into misunderstandings harmful to the design of a complex product.

The browsing system is able to exploit knowledge extracted from textual material in several ways:

- expanding the search by exploiting the search for MWE and then offering suggestions to research incomplete or vague. For example, by proposing the query "Pontormo" are returned as results also the occurrences of "Jacopo da Prontormo", "Jacopo Carucci" and "Pontormo" (Fig. 1);

The screenshot shows the 'Ricerca con DBT Faccette' (Search with DBT Faccette) interface. At the top, there is a search bar with the placeholder 'Termino da cercare: Pontormo'. Below the search bar, the results are displayed in a table format. The first result is for 'Jacopo da Pontormo, diano: introduzione' (document ID 1), and the second result is for 'EBC_100701-00261' (document ID 3). Both results show snippets of text in Italian, with some parts highlighted in red. The first snippet discusses the diary of Jacopo da Pontormo, mentioning his artistic style and influences. The second snippet is about Jacopo Carucci, also known as Pontormo, and his career as a painter and architect. The interface includes a 'Faccette' button and a 'Chiudi' (Close) button.

Figure 1: some results for query "Pontormo"

- improving the correlation process among documents identified, by using specific linguistic resources;
- improving the ranking of results in case of answers classification of responses;
- better organizing the display of the results. The system shows in reply at the queries a variety of contexts. In these results are highlighted all relevant entities or "micro-

semantics". In this way, the next search refinement is facilitated.(Fig. 2);

Il patrimonio era vastissimo ed ancora oggi il centro storico coincide in buona parte con il sito dell'insediamento monastico. Intorno al monastero sorse il casale per la residenza dei coloni a servizio della comunità. La fine del secolo scorso vide la nascita di un altro insediamento monastico, quello dei francescani. 7 eretto dai francescani nel 1688 si trova (fig. 9) un lavabo sostenuto da un capitello, proveniente dal chiostro medievale. Dalla sacrestia si passa nella cappella della Madonna del Carmine in cui si trovano dei bassorilievi a stampella del XIII secolo, provenienti dalla chiesa benedettina, un altare d'altare di legno dorato e intagliato del XVII secolo, una statua lignea del santo. 8 l'ingresso del Palazzetto del Vicario con un interessante stemma cardinalizio. L'interno della chiesa (fig. 11), ad una navata con cappelle laterali, fu completamente trasformato in stile barocco nel XVIII secolo dai francescani. Entrando, a destra, sull'altare della cappella di S. Vito c'è una bella scultura lignea del santo (sec. XVII). 																																																																															

Figure 2: example of queries refinement

An example of browsing in WeBasCH shows that some material constitutes examples of gray literature. For example, the search of "premio" proposes the site of Aliano, particularly the webpage where planned activities for the year 2008 are displayed. This material would be lost over time, even though it provides important information about the natural and cultural heritage of a region.

Figure 3: document retrieved in WebBasCH

In our approach, the creation of linguistic resources is designed to the development of navigation and information retrieval systems, that are able to exploit them. These tools capture, organize, classify and distribute the information in according to the desired objectives. In an open domain, as the Cultural Heritage, information can rarely be classified just with hierarchical criteria. An approach based on principles of "semantic similarity" is more efficient. This approach allows to link information crosswise, seemingly belonging to different categories, but that match to the same

informative need.

The experience in the treatment of large amount of data has not only allowed the refinement of extraction tools for semantically relevant information, but also the creation of terminological resources toolkit.

The more a text is "enriched" with annotations, the better it can be processed by tools for analysis, categorization, browsing and Information Retrieval. The system is not limited to the identification and classification of entities; it also identifies the particular relations between the entities involved.

Conclusion

Our work proposes to overcome the traditional categorization systems and their rigidity, by means of a set of open and adaptive terms classes, which can guide the end user in refining of his/her search.

Such knowledge systems are valuable support on the one hand to networks of e-participation and e-government, on the other hand they offer more information and better performance.
